Seasonal plots

- Data plotted against the individual “seasons” in which the data were observed. (In this case a “season” is a month.)
- Something like a time plot except that the data from each season are overlapped.
- Enables the underlying seasonal pattern to be seen more clearly, and also allows any substantial departures from the seasonal pattern to be easily identified.
- In R: `gg_season()`

Quarterly Australian Beer Production

```
beer <- aus_production ▷  
  select(Quarter, Beer) ▷  
  filter(year(Quarter) ≥ 1992)  
beer ▷ autoplot(Beer)
```

Quarterly Australian Beer Production

```
beer > gg_season(Beer, labels = "right")
```

Multiple seasonal periods

vic_elec

```
## # A tsibble: 52,608 x 5 [30m] <Australia/Melbourne>

```

Multiple seasonal periods

```
vic_elec > gg_season(Demand)
```

Multiple seasonal periods

```
vic_elec > gg_season(Demand, period = "week")
```

Multiple seasonal periods

```
vic_elec > gg_season(Demand, period = "day")
```

Seasonal subseries plots

- Data for each season collected together in time plot as separate time series.
- Enables the underlying seasonal pattern to be seen clearly, and changes in seasonality over time to be visualized.
- In R: `gg_subseries()`

Quarterly Australian Beer Production

```
beer ▷ gg_subseries(Beer)
```

Australian holidays

```
holidays <- tourism %>%  
  filter(Purpose == "Holiday") %>%  
  group_by(State) %>%  
  summarise(Trips = sum(Trips))
```

```
## # A tibble: 640 x 3 [1Q]  
## # Key:      State [8]  
##   State Quarter Trips  
##   <chr>    <qtr> <dbl>  
## 1 ACT     1998 Q1  196.  
## 2 ACT     1998 Q2  127.  
## 3 ACT     1998 Q3  111.

## 9 ACT     2000 Q1  158.
```

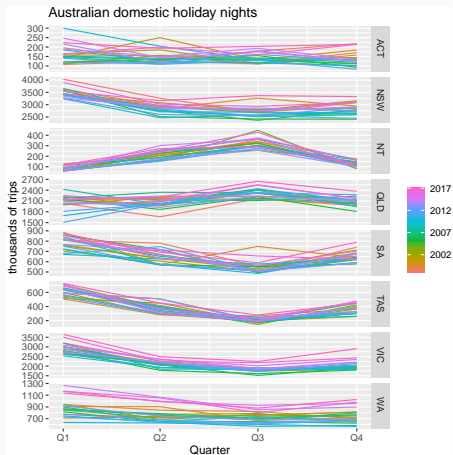

Australian holidays

```
holidays > autoplot(Trips) +  
  labs(y = "thousands of trips", title = "Australian domestic holiday nights")
```

Seasonal plots

```
holidays > gg_season(Trips) +  
  labs(y = "thousands of trips", title = "Australian domestic holiday nights")
```

Seasonal subseries plots

```
holidays > gg_subseries(Trips) +  
  labs(y = "thousands of trips", title = "Australian domestic holiday nights")
```

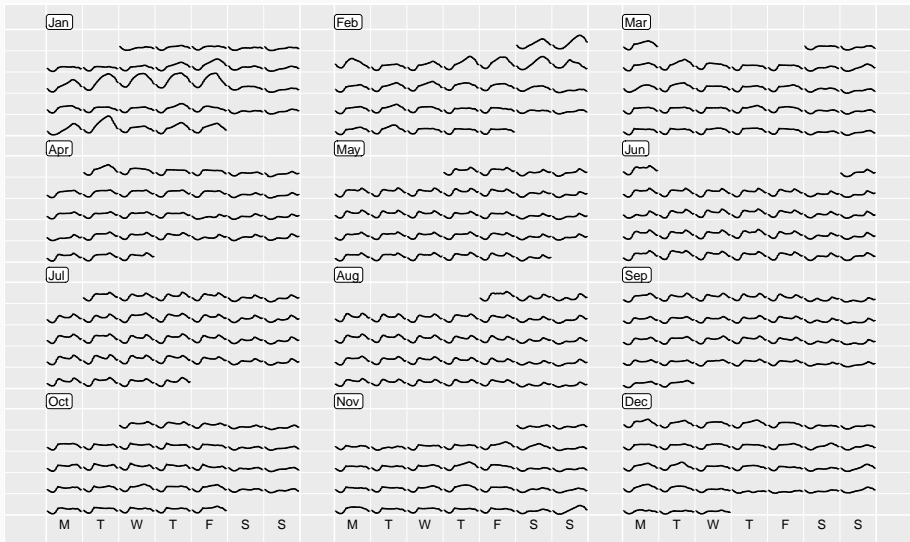

Calendar plots

```
library(sugrrants)
vic_elec >
  filter(year(Date) == 2014) >
  mutate(Hour = hour(Time)) >
  frame_calendar(x = Hour, y = Demand, date = Date, nrow = 4) >
  ggplot(aes(x = .Hour, y = .Demand, group = Date)) +
  geom_line() → p1
prettify(p1,
  size = 3,
  label.padding = unit(0.15, "lines")
)
```

- `frame_calendar()` makes a compact calendar plot
- `facet_calendar()` provides an easier `ggplot2` integration.

Calendar plots

- 7 Lab Session 5

Lab Session 3

1 Look at the quarterly tourism data for the Snowy Mountains

```
snowy <- tourism %>%  
  filter(Region == "Snowy Mountains")
```

- ▶ Use `autoplot()`, `gg_season()` and `gg_subseries()` to explore the data.
- ▶ What do you learn?

2 Produce a calendar plot for the pedestrian data from one location and one year.

Outline

- 7 Lab Session 5

Time series patterns

Trend pattern exists when there is a long-term increase or decrease in the data.

Seasonal pattern exists when a series is influenced by seasonal factors (e.g., the quarter of the year, the month, or day of the week).

Cyclic pattern exists when data exhibit rises and falls that are *not of fixed period* (duration usually of at least 2 years).

Time series components

Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

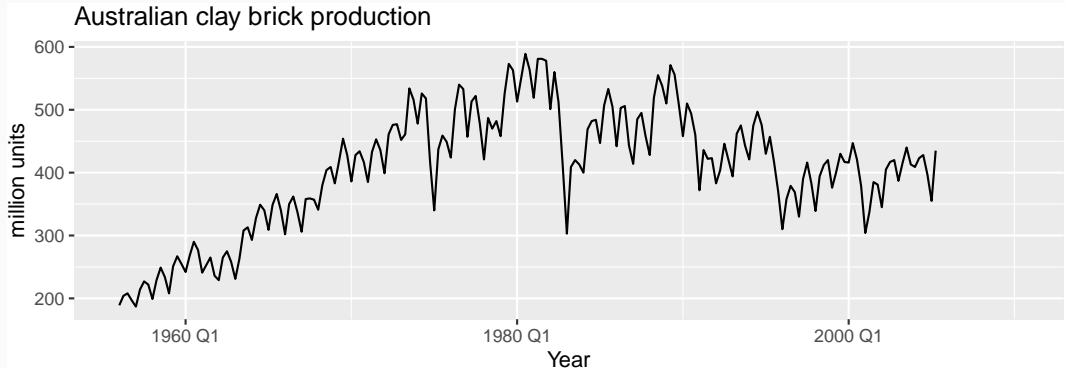

Time series patterns

```
aus_production ▷  
  filter(year(Quarter) ≥ 1980) ▷  
  autoplot(Electricity) +  
  labs(y = "GWh", title = "Australian electricity production")
```

Time series patterns

```
aus_production ▷  
  autoplot(Bricks) +  
  labs(title = "Australian clay brick production",  
        x = "Year", y = "million units")
```

Time series patterns

```
us_employment ▷  
  filter(Title = "Retail Trade", year(Month) ≥ 1980) ▷  
  autoplot(Employed / 1e3) +  
  labs(title = "Retail employment, USA", y = "Million people")
```

Time series patterns

```
gafa_stock ▷  
  filter(Symbol = "AMZN", year(Date) ≥ 2018) ▷  
  autoplot(Close) +  
  labs(title = "Amazon closing stock price", x = "Day", y = "$")
```

Time series patterns

```
pelt ▷  
  autoplot(Lynx) +  
  labs(title = "Annual Canadian Lynx Trappings",  
        x = "Year", y = "Number trapped")
```

Seasonal or cyclic?

Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

Seasonal or cyclic?

Differences between seasonal and cyclic patterns:

- seasonal pattern constant length; cyclic pattern variable length
- average length of cycle longer than length of seasonal pattern
- magnitude of cycle more variable than magnitude of seasonal pattern

The timing of peaks and troughs is predictable with seasonal data, but unpredictable in the long term with cyclic data.

## 7 1993 Q3 410 6570 475 1648 42949 163  
## 8 1993 Q4 512 5675 443 1863 40974 138
```

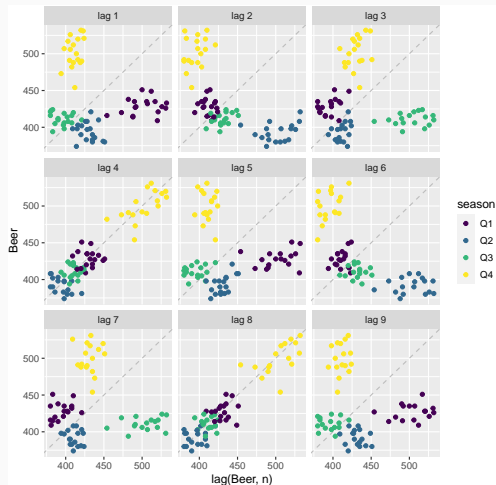

Example: Beer production

```
new_production > gg_lag(Beer)
```

Example: Beer production

```
new_production > gg_lag(Beer, geom = "point")
```

Lagged scatterplots

- Each graph shows y_t plotted against y_{t-k} for different values of k .
- The autocorrelations are the correlations associated with these scatterplots.
- ACF (autocorrelation function):
 - ▶ $r_1 = \text{Correlation}(y_t, y_{t-1})$
 - ▶ $r_2 = \text{Correlation}(y_t, y_{t-2})$
 - ▶ $r_3 = \text{Correlation}(y_t, y_{t-3})$
 - ▶ etc.
- If there is **seasonality**, the ACF at the seasonal lag (e.g., 12 for monthly data) will be **large and positive**.

Autocorrelation

Results for first 9 lags for beer data:

```
new_production > ACF(Beer, lag_max = 9)
```

```
## # A tsibble: 9 x 2 [1Q]
```

```
##   lag    acf
```

## # ... with 142 more rows
```

Australian holidays

```
holidays ▷  
  ACF(Trips) ▷  
  autoplot()
```

Trend and seasonality in ACF plots

- When data have a trend, the autocorrelations for small lags tend to be large and positive.
- When data are seasonal, the autocorrelations will be larger at the seasonal lags (i.e., at multiples of the seasonal frequency)
- When data are trended and seasonal, you see a combination of these effects.

US retail trade employment

```
retail <- us_employment ▷  
  filter(Title = "Retail Trade", year(Month) ≥ 1980)  
retail ▷ autoplot(Employed)
```

US retail trade employment

```
retail ▷  
  ACF(Employed, lag_max = 48) ▷  
  autoplot()
```

Google stock price

```
google_2015 <- gafa_stock %>%  
  filter(Symbol = "GOOG", year(Date) = 2015) %>%  
  select(Date, Close)  
google_2015
```

```
## # A tsibble: 252 x 2 [!]
```

```
##   Date      Close
```

- 2 Lab Session 3
- 3 Seasonal or cyclic?
- 4 Lag plots and autocorrelation
- 5 Lab Session 4**
- 6 White noise
- 7 Lab Session 5

Lab Session 4

We have introduced the following functions: `gg_lag` and `ACF`. Use these functions to explore the four time series: Bricks from `aus_production`, Lynx from `pelt`, Close price of Amazon from `gafa_stock`, Demand from `vic_elec`. Can you spot any seasonality, cyclicity and trend? What do you learn about the series?

Which is which?

1. Daily temperature of cow

2. Monthly accidental deaths

3. Monthly air passengers

4. Annual mink trappings

A

B

C

D

Outline

- 1 Seasonal plots
- 2 Lab Session 3
- 3 Seasonal or cyclic?
- 4 Lag plots and autocorrelation
- 5 Lab Session 4
- 6 White noise
- 7 Lab Session 5

Example: White noise

```
wn <- tsibble(t = seq(36), y = rnorm(36), index = t)  
wn > autoplot(y)
```

Example: White noise

```
wn <- tsibble(t = seq(36), y = rnorm(36), index = t)
wn > autoplot(y)
```

Example: White noise

wn ▷ ACF(y)

r_1	r_2	r_3	r_4	r_5	r_6	r_7	r_8	r_9	r_{10}
-0.019	-0.094	-0.182	-0.086	0.077	-0.061	-0.098	-0.051	0.169	0.042

Example: White noise

wn ▷ ACF(y)

r_1	r_2	r_3	r_4	r_5	r_6	r_7	r_8	r_9	r_{10}
-0.019	-0.094	-0.182	-0.086	0.077	-0.061	-0.098	-0.051	0.169	0.042

- Sample autocorrelations for white noise series.
- Expect each autocorrelation to be close to zero.
- Blue lines show 95% critical values.

Example: Pigs slaughtered

```
pigs <- aus_livestock %>%  
  filter(State = "Victoria", Animal = "Pigs", year(Month) ≥ 2014)  
pigs %>% autoplot(Count / 1e3) +  
  labs(x = "Year", y = "Thousands",  
        title = "Number of pigs slaughtered in Victoria")
```

Example: Pigs slaughtered

```
pigs ▷  
  ACF(Count) ▷  
  autoplot()
```

Example: Pigs slaughtered

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 2014 through December 2018 (Source: Australian Bureau of Statistics.)

Example: Pigs slaughtered

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 2014 through December 2018 (Source: Australian Bureau of Statistics.)

- Difficult to detect pattern in time plot.
- ACF shows significant autocorrelation for lag 2 and 12.
- Indicate some slight seasonality.

Example: Pigs slaughtered

Monthly total number of pigs slaughtered in the state of Victoria, Australia, from January 2014 through December 2018 (Source: Australian Bureau of Statistics.)

- Difficult to detect pattern in time plot.
- ACF shows significant autocorrelation for lag 2 and 12.
- Indicate some slight seasonality.

These show the series is **not a white noise series**.

- 4 Lag plots and autocorrelation
- 5 Lab Session 4
- 6 White noise
- 7 Lab Session 5

Lab Session 5

You can compute the daily changes in the Google stock price in 2018 using

```
dgoog <- gafa_stock %>%  
  filter(Symbol == "GOOG", year(Date) ≥ 2018) %>%  
  mutate(diff = difference(Close))
```

Does `diff` look like white noise?
